DELOITTE FRONTIER GENAI FDE TEAM

Deloitte Frontier GenAI FDE role sits at the point where an impressive prototype either becomes part of the client operating system or remains a demonstration. That boundary is where I have spent much of my career: translating complex technical possibilities into visible work, explicit decisions, reliable handoffs, and measurable operating outcomes.

At Vape-Jet, I work directly across production, quality, support, engineering, ERP, telemetry, customer signals, and a fielded robotics fleet to convert fragmented information into prioritized action and standard operating mechanisms. Through DudeWorth, I design agentic workflow patterns that combine structured context, retrieval, AI agents, human judgment, escalation, evaluation, and governance rails.

At Amazon, I built operating routines for a 24/7 customer-backward environment supporting approximately five million second-day orders annually. Earlier, at Compunetics, I led technical programs, engineering, manufacturing, and quality in high-reliability electronics environments involving demanding stakeholders and consequential failure modes.

That record does not make me a conventional career software engineer, and I would not present it as one. It does make me an operator-technologist who is comfortable entering ambiguous systems, working hands-on with software and workflows, making tradeoffs visible, and building the mechanisms that allow new capabilities to survive real use. I am deliberately pursuing forward deployment because I want to be close to the build and the client problem.

I created an independent candidate vision at <https://russelldudek.github.io/deliotte/> to demonstrate how I would approach the mandate. It includes a working deployment-posture lab and a five-stage Forward Deployment Contract - Frame, Prove, Bound, Embed, and Transfer - that makes human authority, evaluation, observability, economics, and client ownership explicit before a workflow advances.

I would welcome the opportunity to discuss where Deloitte sees the greatest gap between successful GenAI prototypes and client-owned capability, and how an operator production discipline can strengthen an FDE pod speed, empathy, and engineering outcomes.

Carpe diem,

Russell Dudek
