CORE THESIS

The FDE closes the distance between model capability and operating ownership.

ACTUAL MANDATE

Reduce the distance between a client AI ambition and a production-capable workflow without creating uncontrolled technical debt, governance exposure, or permanent dependence on the delivery pod.

OPERATING TENSIONS

01 Frontier speed vs. enterprise control

Prototype rapidly while designing permissions, evidence, cost, latency, support, and ownership from the start.

02 Client specificity vs. reusable delivery IP

Fit the real workflow while retaining code, evaluations, prompts, runbooks, and lessons that improve the next engagement.

03 Model capability vs. system reliability

Move beyond impressive single outputs toward repeated-run stability, tool-state integrity, recovery, and maintainability.

04 Agent autonomy vs. human authority

Earn autonomy through consequence, evidence, permissions, and reversibility.

PROOF MAP

Vape-Jet

Embedded operating problem solving across production, quality, support, engineering, ERP, telemetry, and field-machine signals.

DudeWorth

Agentic workflow architecture using context, retrieval, agents, human judgment, escalation, evaluation, and governance.

Amazon

Production discipline, throughput visibility, escalation, standard work, safety, quality, and customer outcomes.

Compunetics

Engineering, manufacturing, quality, technical programs, and high-consequence stakeholder environments.

STRONGEST OBJECTION

Does broad operations and leadership experience translate into daily coding, testing, debugging, documentation, and contribution inside an FDE pod?

The concern is reasonable. My titles describe the scope of problems for which I have been accountable - not a preference to remain distant from the work. Judge the direct artifacts, technical reasoning, workflow logic, evaluation discipline, and willingness to state exactly where platform-production evidence is not yet verified.

FIVE INTERVIEW CLAIMS

- Use-case selection is an engineering decision.
- Evaluation must represent the workflow, not merely the model.
- Human review is an architecture component.
- Production begins before deployment through logging, production, versioning, tests, ownership, rollback, and cost visibility.
- Every engagement should leave behind a client-owned workflow and reusable delivery assets.

EXECUTIVE QUESTIONS

- What distinguishes the Frontier GenAI FDE model from established AI-engineering delivery?
- At what point is a prototype considered successful?
- Where have client GenAI programs most commonly stalled after successful prototypes?
- What does excellent Associate FDE performance look like after six months?
